Test Duration

1. The environmental systems were started at 12:00 hours, 11/29/12.
2. The test parameters were considered stable for two consecutive four hour test periods from 23:20 hours, 11/29/12 to 07:20 hours, 11/30/12.
3. The thermal performance test results were derived from 03:20 hours, 11/30/12 to 07:20 hours, 11/30/12.

The reported Standardized Thermal Transmittance (U_{st}) was determined using CTS Method, per Section 8.2(A) of NFRC 102.

Edge Gap Width	0.51"	0.51"
Estimated center gap width upon receipt of specimen in laboratory (after stabilization)	0.42"	0.42"
Center gap width at laboratory ambient conditions on day of testing	0.42"	0.42"
Center gap width at test conditions	0.36"	0.36"

Glass collapse determined using a digital glass and air space meter

The sample was inspected for the formation of frost or condensation, which may influence the surface temperature measurements. The sample showed no evidence of condensation/frost at the conclusion of the test.

"This test method does not include procedures to determine the heat flow due to either air movement through the specimen or solar radiation effects. As a consequence, the thermal transmittance results obtained do not reflect performances which may be expected from field installations due to not accounting for solar radiation, air leakage effects, and the thermal bridge effects that may occur due to the specific design and construction of the fenestration system opening. Therefore, it should be recognized that the thermal transmittance results obtained from this test method are for ideal laboratory conditions and should only be used for fenestration product comparisons and as input to thermal performance analyses which also include solar, air leakage and thermal bridge effects."

The test sample was installed in a vertical orientation, the exterior of the specimen was exposed to the cold side. The direction of heat transfer was from the interior (warm side) to the exterior (cold side) of the specimen. The ratings were rounded in accordance to NFRC 601, NFRC Unit and Measurement Policy.

ANSI/NCSL Z540-2-1997 type B uncertainty for this test was 1.70%.

Required annual calibrations for the Architectural Testing Inc. 'thermal test chamber' (ICN N000235) in St. Paul, Minnesota were last conducted in September 2012 in accordance with Architectural Testing Inc. calibration procedure. A CTS Calibration verification was performed November 2012. A Metering Box Wall Transducer and Surround Panel Flanking Loss Characterization was performed September 2012.
